

Incident 001: Checkout API Latency

Summary

The checkout API experienced a significant increase in response latency.

Impact

Users experienced slow checkout requests.

The checkout API p95 latency increased from approximately 400ms to 2.3 seconds.

Timeline

14:00 - Deployment version 2.4.1 started.

14:07 - Checkout API latency began increasing.

14:10 - Error rate increased significantly.

14:15 - Engineers began investigating the incident.

14:25 - Database connection timeout errors were identified.

14:40 - Deployment 2.4.1 was rolled back.

14:45 - Latency returned to normal levels.

Root Cause

Deployment version 2.4.1 introduced a database connection configuration that caused the checkout service to exhaust available database connections.

Resolution

The engineering team rolled back deployment 2.4.1.

Prevention

Future deployments should validate database connection pool configuration before production rollout.
